

Lean is the trusted kernel — it is not an oracle for physics

The kernel decides one thing: does the conclusion follow from the encoded assumptions. Whether the encoding is the intended object is decided by a separate, source-blind audit.

KERNEL_CHECKED

The conclusion follows from the definitions and assumptions you encoded.

Mechanically checkable. Reproducible from a clean environment.

STILL UNDECIDED

Whether that encoding is the physical object, regime, and observable you meant.

Needs a domain reviewer. No kernel can settle it.
